

Product Update

Title: Update firmware for the KVM.net

No: 200710-02

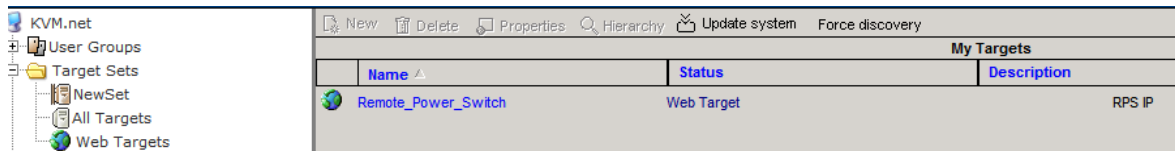

Contact: mtu@minicom.com

Summary: The KVM.net firmware was recently updated to include product operation enhancements.

More Information

We updated the KVM.net firmware to version 4.0.2.5. This version has following main improvements:

- New feature “Web Targets” is added to the KVM.net system, with this feature you can add a list of web page that can be accessed from the KVM.net system.

- Added new mode to control the DX system called “Managed by KVM.net mode”. In this mode KVM.net remove users can view if a server is been controlled by a DX system local user
- Added support for Windows Vista through use of the new ActiveX Client (version 4.0.0.42) to connect to the KVM.net from a Windows Vista client you need to launch Internet Explorer as Administrator.
- Improvement to the Master/Slave replication failure notifications.
- Reducing the network overhead and increasing device stability. This allows the KVM.net system to work faster in a large scale installations

The complete release notes for KVM.net v4.0.25 can be found at:

<http://support.minicom.com/kvmnet/docs/ipa22-1.pdf>

Visit the KVM.net Upgrades and Documentation page at:

<http://www.minicom.com/phandln.htm> to find how to upgrade your KVM.net v4.0.1.1 to v4.0.2.5

Notes:

If you have a KVM.net system prior to version 4.0.1.1 please contact Minicom technical support department at: support@minicom.com for information on how to upgrade your KVM.net system.
